

For IMMEDIATE Release

Broadcast Asia 2008

June 2008

Stand Number 8M2-07

World-wide Launch of New DAB & DMB Service Monitoring Receiver

DABSTOR Rx

Demonstrated at Broadcast Asia 2008 (Stand Number 8M2-07)

SommerData is showcasing the new **DABSTOR Rx** in a World-wide Launch at Broadcast Asia 2008. This unique receiver enables users to remotely access multiple DAB & DMB Audio, Video and Data services at the same time.

A first for SommerData, users are able to simultaneously view multiple Audio, Video and Data services from a single receiver. **DABSTOR-Rx** eliminates the need to use several receivers per DAB/DMB Ensemble, thereby freeing-up valuable space and resources. Combine this with the remote monitoring capabilities – enabling viewing stations at one or more locations across a multicast network – and it is easy to see why the SommerData **DABSTOR-Rx** is expected to be the latest *must have* professional service monitoring product for broadcasters and network service providers.

Supporting the main Audio, Video and Data service types, including DAB+ and DMB with BIFS, the software used for the remote monitoring is also compatible with the SommerData **DABSTOR ET/ Monitor** application. Further developments during 2008 will see the introduction of an endless-loop Logger and service Monitor/Analyser options, extending the versatility of this unique service monitoring receiver.

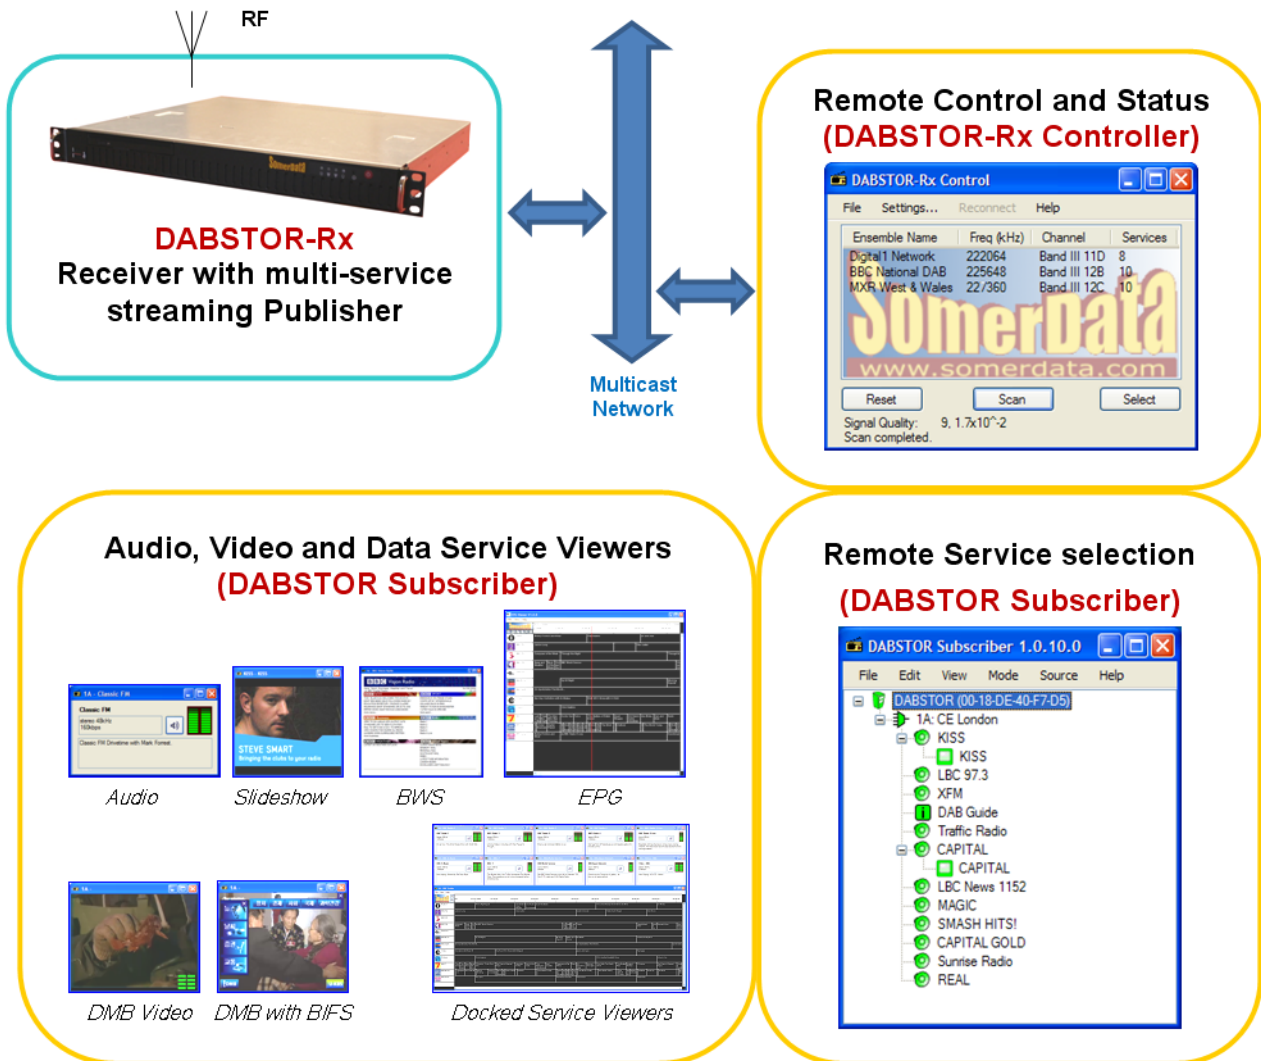

Also being demonstrated...

The new **DABAIR-II** USB receiver for DAB & DMB Audio, Video and Data services is designed to be used as a portable device and is ideal for field monitoring. It allows broadcasters and network service providers to verify RF coverage and service availability simply by plugging in to a laptop PC. The GPS logging is compatible with Google Earth™, allowing for easy graphical indication of signal level by location. A service can also be viewed in real time via the optional DAB/DMB media player.
