LONDON--(BUSINESS WIRE)--Frontier Silicon, the leading supplier of Digital Radio and Network Audio solutions, today announces the launch of Venice 8.1, the latest in their successful Venice range of modules.

In response to the increasing use of multi-media capabilities by digital radio broadcasters, Frontier Silicon has introduced the Venice 8.1 module bringing a highly responsive colour touch-screen graphical-user-interface into competitively priced DAB/DAB+ radios. This module gives OEMs and ODMs the opportunity to bring advanced digital radios and dockers to the market, which are able to display slideshow images broadcast over DAB or DAB+ providing a colourful and informative backdrop to any radio programme. Slideshow is rapidly becoming a feature of DAB/DAB+ broadcasts across Europe as well as in Australia and Hong Kong and it provides radio manufacturers with a significant opportunity to differentiate their products with a colour display and deliver a rich radio experience to consumers.

In the ever evolving media market, broadcasters continue to develop and support technology which differentiates and enhances digital broadcasting. DAB/DAB+ Slideshow, which allows rich images to be sent alongside broadcast audio content, is a good example of such technology. DAB/DAB+ Slideshow is an established part of the WorldDMB family of standards and is a robust, mature technology. Frontier Silicon's mass market proven tools allow brands and manufacturers to quickly produce advanced multimedia radios to take advantage of this enhancement to broadcast radio.

Company Information Center

Frontier Silicon

Steve Evans, Vice President of Marketing and Business Development at Frontier Silicon, said, "It is great to see the rapid progress that broadcasters are making as they exploit the opportunities to innovate that digital radio brings over and above FM radio. The full digital radio experience is about more than just receiving audio and Frontier Silicon remains committed to ensure that our customers can build exciting products that bring listeners the benefits of these advances in technology."
