

For IMMEDIATE Release

IBC 2008

September 2008

Stand Number 8.C97

First Showing of a new Multi-mode DAB & DMB Professional Monitoring Receiver at IBC 2008

DABSTOR-Rx Off-air Logger and Monitor Demonstrated at IBC 2008 (Stand Number 8.C97)

In a major advance in professional DAB/DAB⁺/DMB monitoring receivers, SomersData is demonstrating off-air Ensemble Logging and Ensemble Monitoring at IBC 2008 (Stand Number 8.C97).

Designed for broadcasters and network operators, the **DABSTOR-Rx** Monitoring Receiver provides evidence of transmission, with live monitoring, logging and off-line analysis of a complete DAB/DAB⁺/DMB Ensemble.

SomersData's Engineers have achieved this innovation by regenerating the ensemble transport stream (which is not normally available in DAB/DAB⁺/DMB receivers) to provide compatibility with SomersData's existing head-end Logger and Monitor applications.

The Ensemble Logger application provides continuous, capture using sequential-file endless-loop recording, which is a technique originally developed by SomersData for a data communications logger product in 1998.

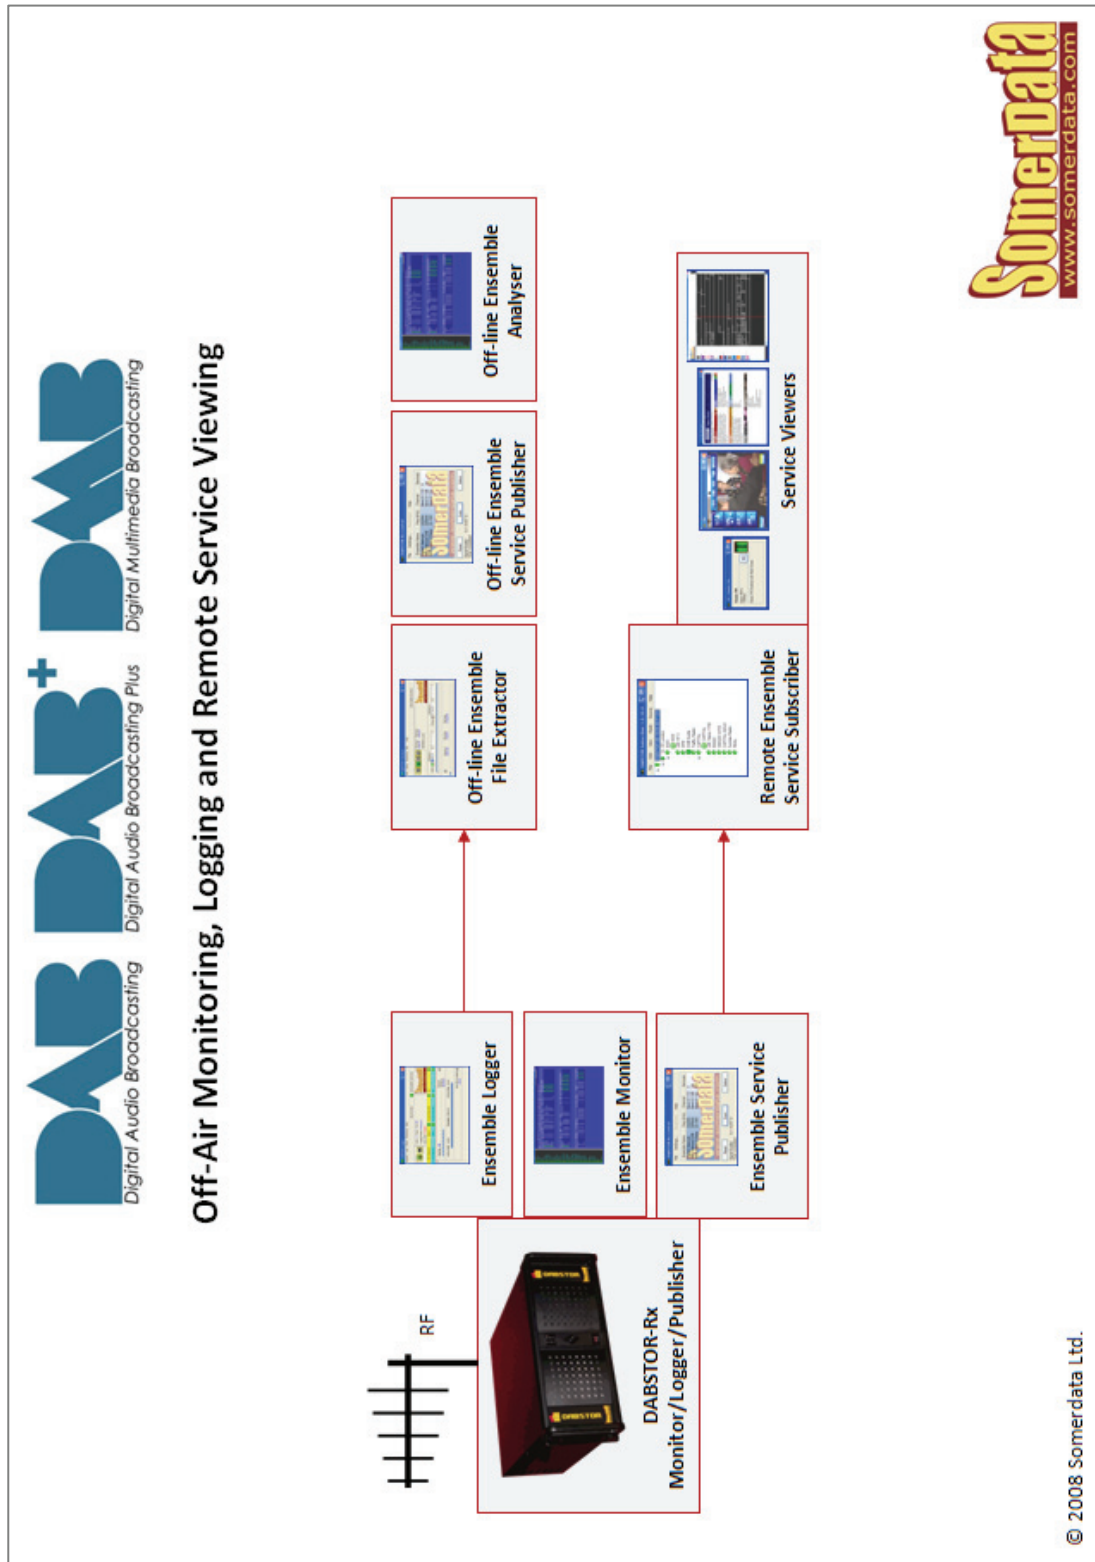

In addition to the new Ensemble Logger and Ensemble Monitor options, users are able to simultaneously view multiple Audio, Video and Data services from a single receiver. **DABSTOR-Rx** eliminates the need to use several receivers per DAB/DAB⁺/DMB Ensemble, thereby freeing-up valuable space and resources.

Combined with unique remote monitoring capabilities – enabling viewing stations at one or more locations across a multicast network – **DABSTOR-Rx** sets a new benchmark in professional service monitoring products for broadcasters and network service providers.

Somersdata Ltd. is based in Wells, Somerset, UK. At the forefront of Digital Audio Broadcast (DAB) and Digital Multimedia Broadcast (DMB) applications, SomersData offers an innovative range of digital capture, monitoring, logging, recording, replay, analysis and signal routing products for broadcasters, network operators and receiver manufacturers.
